Workflow Benefits

With the General Ledger Account Key Changer from Data Developers Plus all account information, in a Pro Series and Sage Pro Series* Accounts Payable, Accounts Receivable, General Ledger, Inventory Control, Job Cost, Purchase Orders, Payroll, Sales Order, and Manufacturing modules can be changed fast, accurately and completely. This includes account history data that will transfer from an old number to a new account number when using the GL Account Key Changer. Two versions of this accounting solution are available: one uses a graphic user interface ("GUI"). A more powerful version requires key entries through a PRG interface. Both versions of the GL Account Key Changer include the option to merge General Ledger accounts. All changes made through the GL Account Key Changer are tracked in the Pro Series key change log for review and audit.

* Compatible with Pro Series 5, 6, 6.5, Sage Pro 7.x VFP & SQL

The GUI version is intuitive and easy to use from a Custom Menu. This version expedites changing one GL account at a time. Accounts can be merged in the GUI version of the GL Account Key Changer. See the Graphical User interface sample on the right.

The PRG version of the GL Account Key Changer is required to make changes in account structures. Some programming skills and a full development copy of Visual FoxPro is required. Multiple accounts can be changed at one time and global changes to the complete GL account structure can also be facilitated. Functionalities include changing the number and size of account segments and mapping the history from all of the accounting modules into the new account schema. By creating and saving a spreadsheet as a database with old and new account numbers the PRG version of the GL Account Key Changer will implement the new structures with documentations in the change log.
